ClubConnect Database Design

1. ERD Schema

University(universityID, name, emailDomain, address, zipCode, city, state, website)
Club(clubID, name, description, constitution, startDate, email, logo, *universityID,* clubCategory)
Student(studentID, firstName, lastName, emailAddress, program, graduationDate, enrollmentYear, dateOfBirth, profilePicture, *universityID*)
Role(roleID, roleTitle, roleDescription)
Membership(*clubID*, *roleID*, *studentID*, description, joinDate, isActive, memberType)
Event(eventID, date, time, title, location, description, contact, *statusID*, *clubID,* eventType)
Status(statusID, status)
Interview(interviewID, date, time, *studentID*, *roleID*, platform*, statusID, clubID*)

2. Functional Dependencies of the ERD Schema by each entity (with proof of BCNF)

A relation is in BCNF if for every functional dependency X→Y, where X is a superkey.

University

- This relation is already in BCNF since **universityID** is the primary key (or super key) and there are no partial or transitive dependencies.
- Functional dependency:
    - universityID → name, emailDomain, address, zipCode, city, state, website

Club

- This relation is in BCNF because **clubID** is the primary key (or super key) and determines all the other attributes.
- Functional dependency:
    - clubID → name, description, constitution, startDate, email, logo, universityID, clubCategory

Student

- This relation is in BCNF because **studentID** is the primary key (or super key) and determines all the other attributes.
- Functional dependency:
    - studentID → firstName, lastName, emailAddress, program, graduationDate, enrollmentYear, dateOfBirth, profilePicture, universityID

Role

- This relation is in BCNF because **roleID** is the primary key (or super key) and determines all the other attributes.

- Functional dependency:
    - roleID ⟶ roleTitle, roleDescription

Membership

- This relation is in BCNF because the composite key (**clubID**, **roleID**, **studentID**) is the primary key (or super key) and determines all the other attributes.
- Functional dependency:
    - (clubID, roleID, studentID) ⟶ description, joinDate, isActive, memberType

Event

- This relation is in BCNF because **eventID** is the primary key (or super key) and determines all the other attributes.
- Functional dependency:
    - eventID ⟶ date, time, title, location, description, contact, statusID, clubID, eventType

Status

- This relation is in BCNF because **statusID** is the primary key (or super key) and determines status.
- Functional dependency:
    - statusID ⟶ status

Interview

- This relation is in BCNF because **interviewID** is the primary key (or super key) and determines all the other attributes.
- Functional dependency:
    - interviewID ⟶ date, time, roleID, platform, statusID, clubID, studentID
